EXPERIMENT — 8b

S.Vishal 240701600

Create Storyboards to Represent the User Flow for a Mobile Ap Using OpenBoard

AIM

The aim of this experiment is to map out the complete user flow for a Food Delivery mobile application (QuickBite) by designing storyboards using OpenBoard. The storyboards visually represent each screen of the application and the navigation transitions between them, helping communicate the intended user experience before development begins.

Tool Used

- OpenBoard – for creating digital storyboard frames and flow diagrams
- Paper and Pen – for initial user flow sketches
- Tool Link: https://openboard.ch/download.en.html

PROCEDURE

Step 1: Define the User Flow

1. Identify Key Screens:

The QuickBite food delivery app requires the following main screens to support the complete ordering experience:

- Home Screen – Search bar, promotional banners, cuisine categories, and nearby restaurant listings.
- Menu Screen – Restaurant information, item category tabs, food item cards with prices and Add button.
- Cart Screen – Added items with quantity controls, bill summary, promo code entry, and checkout button.
- Checkout Screen – Delivery address, payment method selection, and order summary with total.
- Order Confirmation Screen – Confirmation message, order ID, progress tracker, and order details.
- Live Tracking Screen – Real-time map view, delivery partner card with call/chat options.

2. Map the User Journey:

A typical user of the QuickBite app goes through the following journey from opening the app to receiving their food:

- User opens the app and browses the Home Screen to find a desired restaurant.
- User taps a restaurant card to view the Menu Screen and browses available food items.
- User adds desired items to the cart by tapping the "+ Add" button on the Menu Screen.
- User navigates to the Cart Screen to review selected items, quantities, and total amount.
- User proceeds to the Checkout Screen to confirm delivery address and select payment method.
- User places the order and is redirected to the Order Confirmation Screen with an order summary.

- User tracks the delivery in real time via the Live Tracking Screen until the order is delivered.

Step 2: Create Storyboards Using OpenBoard

1. Install OpenBoard: OpenBoard was downloaded from the official website (https://openboard.ch/download.en.html) and installed on the system. A new blank whiteboard document was created to begin the storyboard.

2. Create a New Document: OpenBoard was launched and a new document was created. The canvas was set to landscape orientation to allow side-by-side frame layout for the storyboard.

3. Add Frames for Each Screen: A separate frame (rectangular boundary) was drawn for each key screen of the QuickBite – Food Delivery App using OpenBoard's rectangle shape tool. Each frame was sized to represent a mobile phone screen with a header and footer area. Six frames were created in total, arranged in two rows of three.

4. Sketch Each Screen: OpenBoard's pen tool was used to sketch the basic UI layout inside each frame. Key UI components were drawn for each screen including buttons, input fields, cards, icons, and navigation bars. Labels were added using the text tool to identify each component.

5. Organise the Flow: The frames were arranged in sequence from left to right, top to bottom, to represent the logical user journey through the application. Flow arrows were drawn between frames using OpenBoard's line and arrow tools to indicate navigation transitions triggered by user actions.

Screen Descriptions

Screen 1: Home Screen

The Home Screen is the entry point of the QuickBite application. It features a prominent search bar at the top for finding restaurants or cuisines. A promotional banner highlights current offers (e.g., 50% OFF First Order). A horizontal category row displays cuisine icons (Pizza, Burger, Sushi, Indian) for quick filtering. Below it, a Nearby Restaurants section lists restaurant cards with name, rating, estimated delivery time, and minimum order amount.

- Search bar for restaurants and cuisines
- Promotional banner with active offer
- Cuisine category icons for quick filtering
- Restaurant cards with ratings, delivery time, and min order

Screen 2: Menu Screen

The Menu Screen opens when a user taps a restaurant. The top section shows a restaurant info banner with name, rating, delivery time, minimum order, and free delivery threshold. Category filter tabs (All, Starters, Pizza, Drinks) are displayed horizontally for easy navigation. Each menu item card shows a thumbnail placeholder, item name, short description, price, and an Add button.

- Restaurant info banner with rating and delivery details
- Category filter tabs (All / Starters / Pizza / Drinks)
- Item cards with image, name, description, price, and Add button

Screen 3: Cart Screen

The Cart Screen lists all items added by the user with quantity increment/decrement controls. A bill summary section shows Subtotal, Delivery charges, Discount, and Total Payable with clear colour coding. A promo code input field is provided for additional discounts. The prominent "Proceed to Checkout" button

is placed at the bottom.

- Cart items with quantity controls
- Bill summary: subtotal, delivery, discount, total
- Promo code input field
- Proceed to Checkout button

Screen 4: Checkout Screen

The Checkout Screen shows the confirmed delivery address with a Change button. Three payment method options — UPI, Credit/Debit Card, and Cash on Delivery — are shown as radio-button style selectors. An order summary card below recaps the item count and total payable amount. The "Place Order" button with the total is placed at the bottom.

- Delivery address with Change option
- Payment method: UPI / Card / COD selection
- Order summary recap
- Place Order button with total amount

Screen 5: Order Confirmation Screen

The Order Confirmation Screen confirms successful order placement. A green checkmark icon with "Order Placed!" is shown prominently. The estimated delivery time is displayed below. An order ID is highlighted in an accent-coloured bar. A horizontal progress tracker shows the four stages: Confirmed, Preparing, Picked Up, and Delivered. A map placeholder and an itemised order summary are shown below.

- Green confirmation checkmark and message
- Estimated delivery time
- Order ID bar
- Progress tracker: Confirmed > Preparing > Picked Up > Delivered

Screen 6: Live Tracking Screen

The Live Tracking Screen provides real-time delivery visibility. A large map area shows the delivery partner's location and the customer's home pin with a route line between them. Below the map, a delivery partner card shows the partner's name, rating, and Call/Chat action buttons. A support section at the bottom allows the user to contact customer care.

- Live map view with delivery partner and home pins
- Route line showing current delivery path
- Delivery partner card with Call and Chat buttons
- Contact support link

Storyboard Output — OpenBoard Screens

The following storyboard frames show the complete user flow for the QuickBite – Food Delivery App. Each frame represents a screen, and the arrows between frames indicate user actions and navigation transitions.

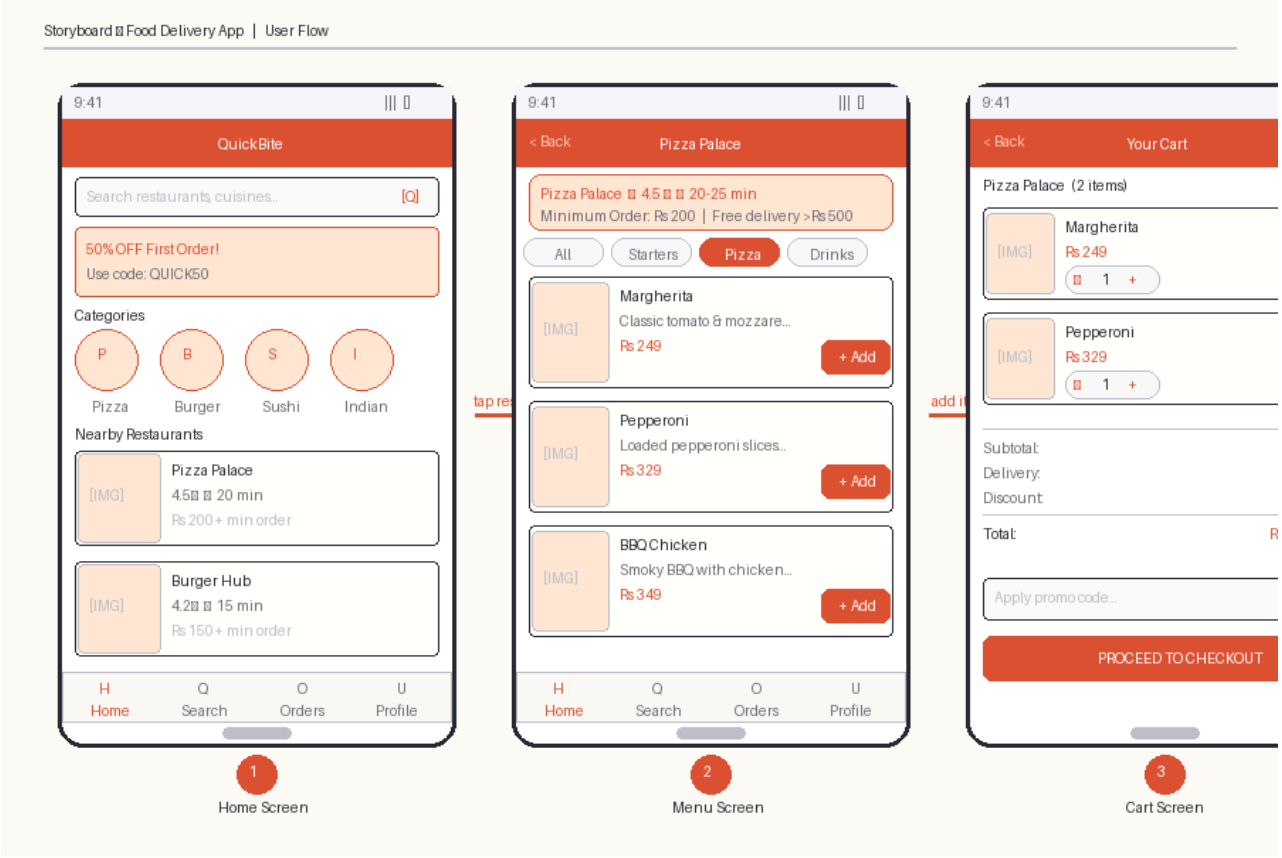

Fig 1: Storyboard Frames 1–3 — Home Screen → Menu Screen → Cart Screen (with flow arrows)

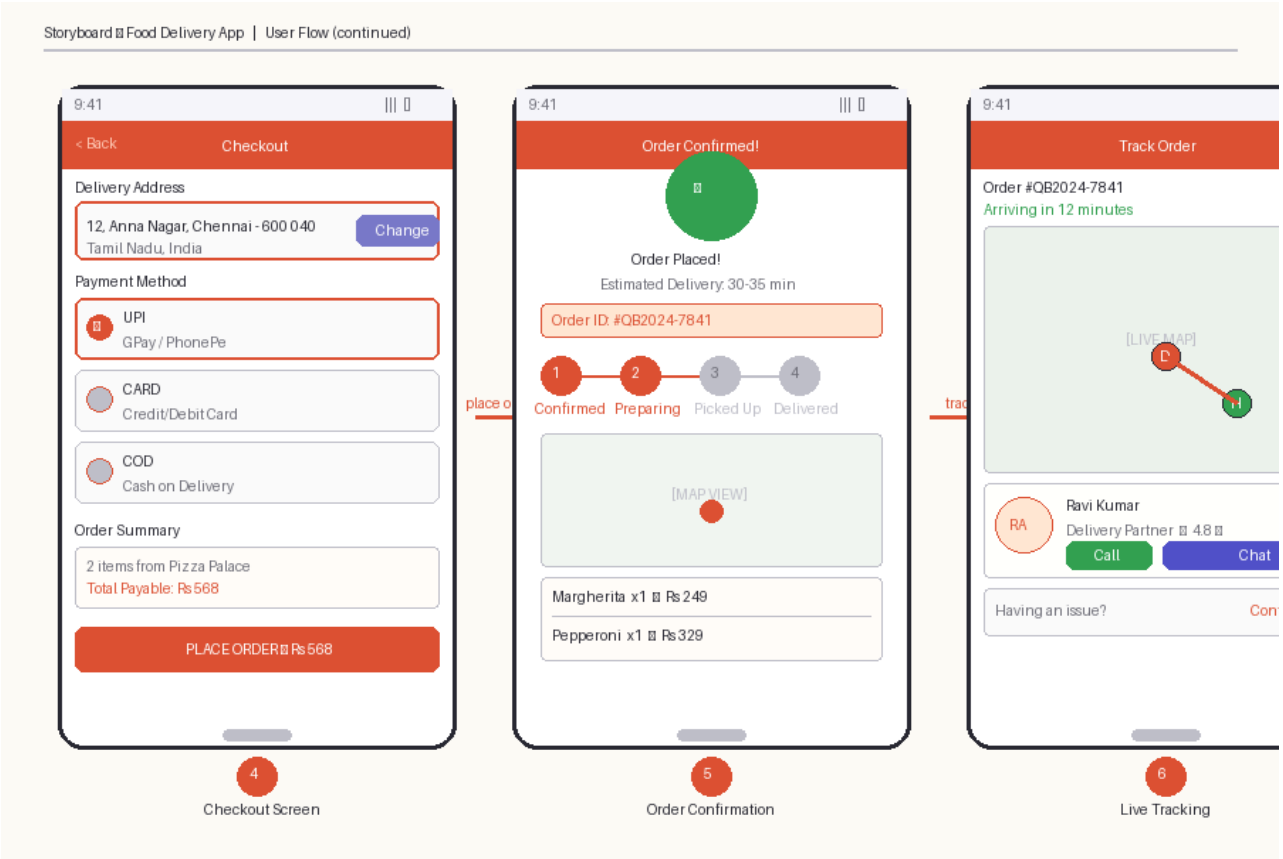

Fig 2: Storyboard Frames 4–6 — Checkout Screen → Order Confirmation → Live Tracking (with flow arrows)

User Flow Summary

The complete user flow for the QuickBite Food Delivery App is summarised below. The storyboard frames follow this sequence, with flow arrows indicating the user action that triggers each screen transition:

Step	Screen	User Action	Next Screen
1	Home Screen	Tap on a restaurant card	Menu Screen
2	Menu Screen	Tap "+ Add" on a food item	Cart Screen
3	Cart Screen	Tap "Proceed to Checkout"	Checkout Screen
4	Checkout Screen	Tap "Place Order"	Order Confirmation
5	Order Confirmation	Tap "Track Order"	Live Tracking Screen
6	Live Tracking	Order delivered	Home Screen (loop)

Result

The experiment was completed successfully. A complete user flow storyboard for the QuickBite Food Delivery App was created using OpenBoard. Six screens were designed — Home, Menu, Cart, Checkout, Order Confirmation, and Live Tracking — and arranged in sequence with flow arrows. The storyboard clearly communicates the user journey from browsing restaurants to tracking a live delivery.

Conclusion

Storyboarding is an effective technique for mapping out the user journey of a mobile application before development begins. Using OpenBoard, it was possible to quickly create structured, annotated storyboard frames and connect them with flow arrows to represent screen transitions. The QuickBite Food Delivery App storyboard demonstrates how each user action leads to a new screen, providing a clear visual communication tool for designers, developers, and stakeholders. This exercise reinforces the importance of user flow planning in the UI/UX design process.
