EXPERIMENT – 2

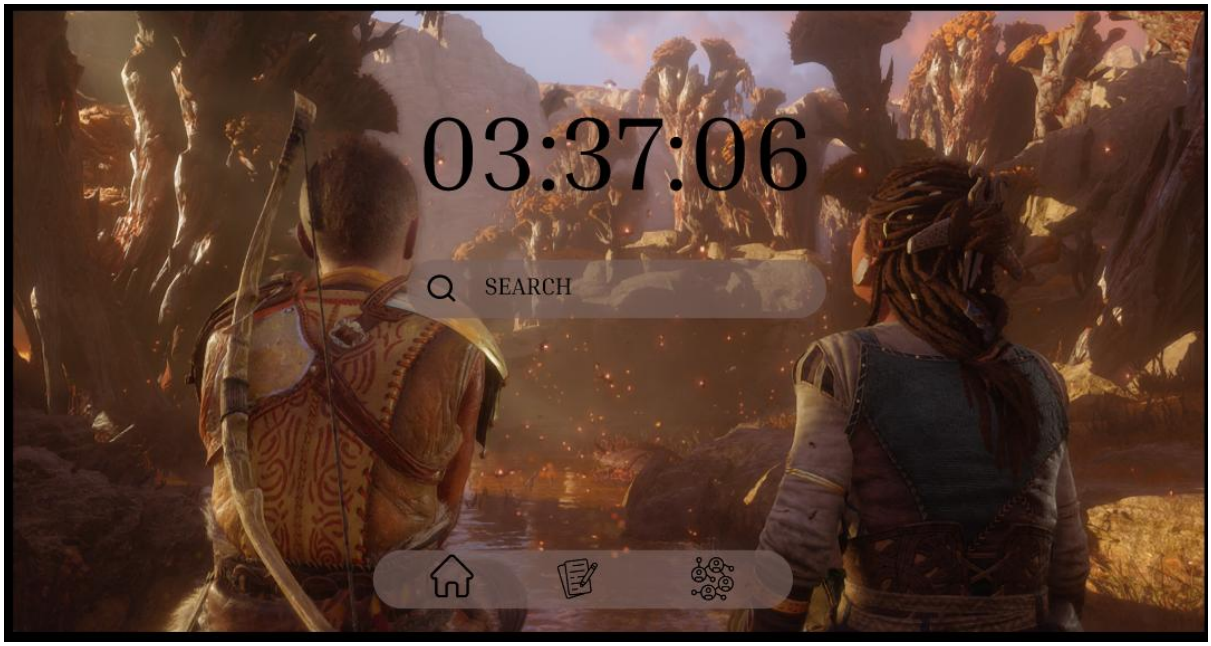
USER INTERFACE AND DESIGN
INTERFACE DESIGN BASED ON CHUNKING, MEMORY AND RECALL PRINCIPLES

Prototype Link: *https://www.figma.com/proto/sQJDEBnTEaCd3KT3HOjPhg/WEEK-2-CHUNKING?node-id=3-4&starting-point-node-id=3%3A4*

Design Concept:

This interface is designed using the psychological principles of **Chunking** and **Memory Recall**. Instead of presenting many options on a single screen, the content is divided into **logical groups (chunks)** so that the user can easily remember, recognize, and navigate through the system without cognitive overload.

Screen 1 – Home Screen (Clock + Search + Navigation)



Design Style:

- A visually rich background is used to capture attention.
- Minimal elements are placed on top: **time, search bar, and bottom navigation icons**.
- Reduces clutter and focuses on essential actions.

Chunking Principle:

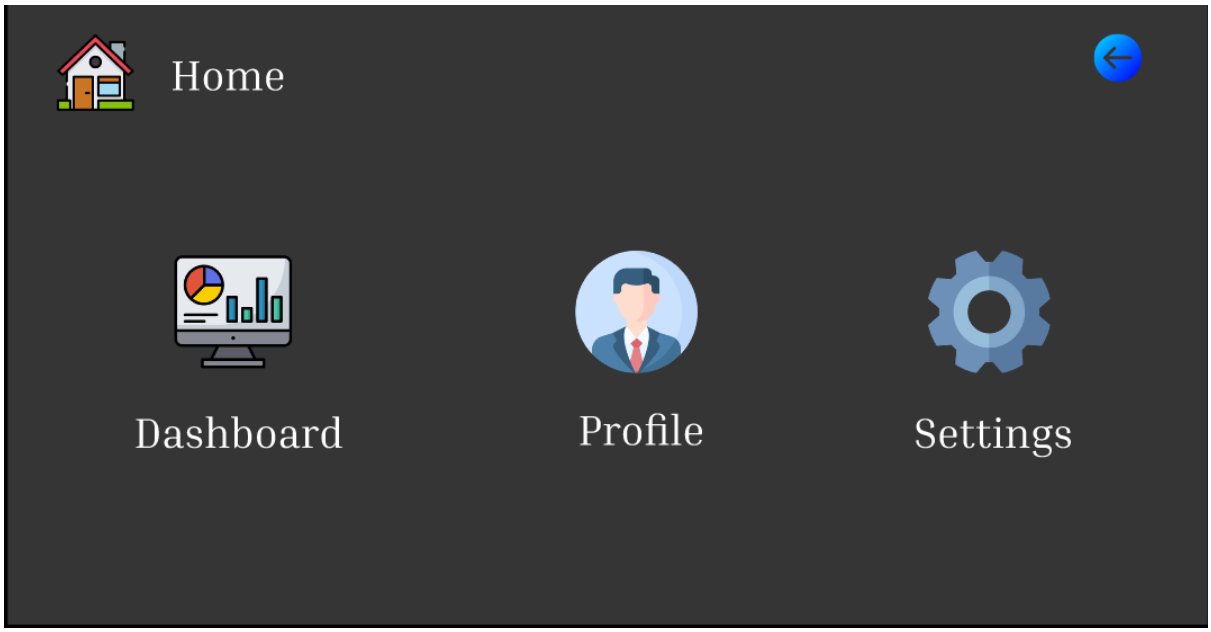
- Only **three primary actions** are visible:
    - Search

    - Navigation icons
    - Time display
- This limits information to a manageable memory unit.

Memory & Recall:

- Users remember this as the **starting hub**.
- Bottom icons act as recall triggers for different sections.

Screen 2 – Home Category (Dashboard / Profile / Settings)



Design Style:

- Three large icons with labels are placed with equal spacing.
- Clear visual grouping of system-level controls.

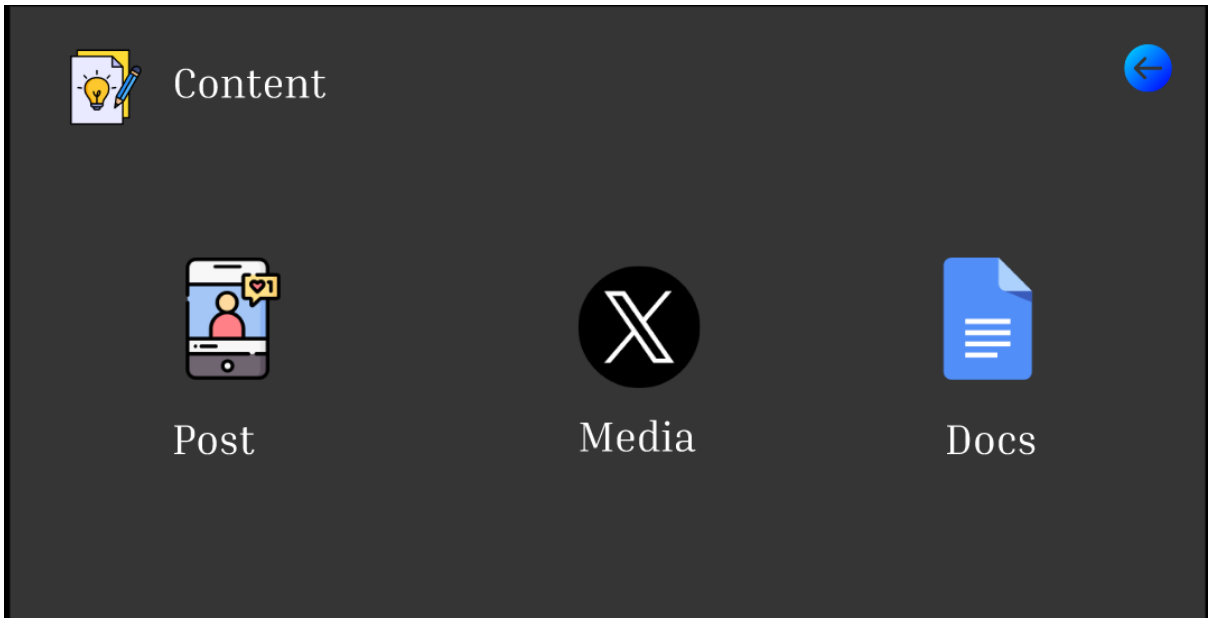
Chunking Principle:

- These options are grouped as **system management functions**.
- Users can easily remember: *Home = Dashboard, Profile, Settings*.

Memory & Recall:

- Recognizable icons (monitor, user, gear) help users recall functionality without reading text.

Screen 3 – Content Category (Post / Media / Docs)



Design Style:

- Another group of three options, visually similar layout to previous screen.
- Maintains consistency in spacing and structure.

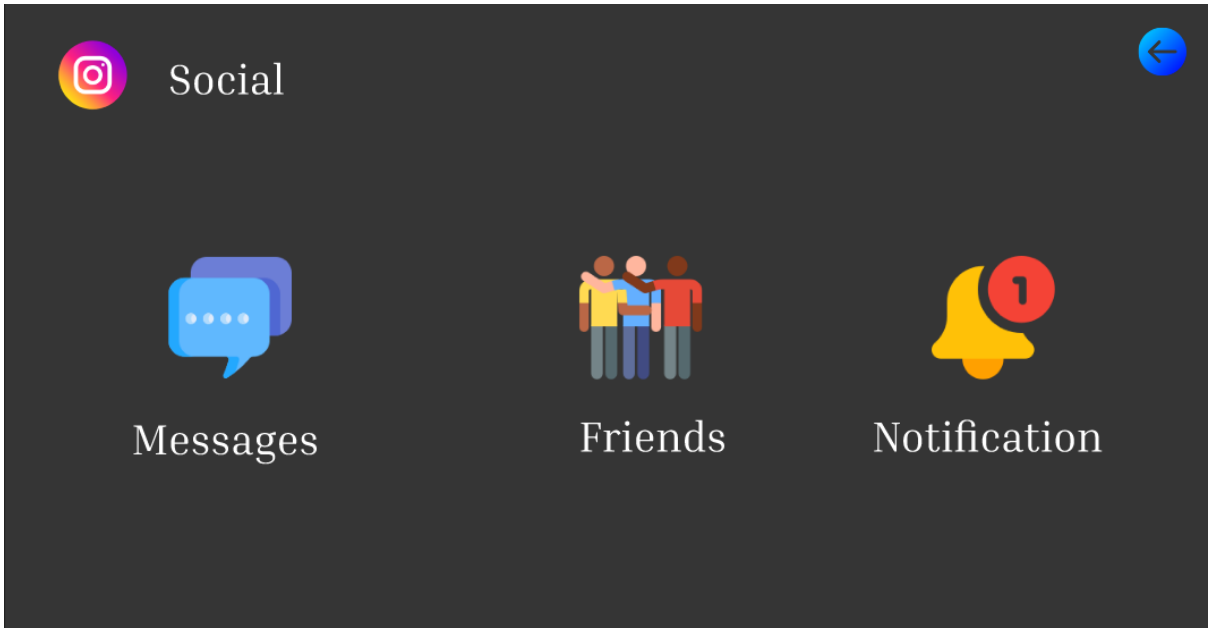
Chunking Principle:

- All **content-related actions** are grouped together.
- Users mentally map: *Content = Post, Media, Docs*.

Memory & Recall:

- Familiar symbols (post, X/media, document) trigger instant recognition.
- Repetition of layout improves memory retention.

Screen 4 – Social Category (Messages / Friends / Notification)



Design Style:

- Same 3-item layout, maintaining design consistency.
- Social interaction tools grouped together.

Chunking Principle:

- Users remember this chunk as **communication section**.
- Limits choices to three, avoiding overload.

Memory & Recall:

- Chat bubble, group icon, and bell icon are universally recognizable.
- Users do not need instructions to understand purpose.

Navigation Consistency:

- Back arrow on every screen ensures easy return (recall of previous step).
- Same layout pattern across screens reduces learning time.
- Icons + text combination supports both visual and verbal memory.

Color and Visual Appeal:

- Dark theme reduces strain and improves focus on icons.
- High contrast icons improve visibility and recognition.
- Consistent typography and spacing create a predictable pattern.

Purpose:

- Designed to **reduce cognitive load**.
- Helps users remember navigation through grouped information.
- Suitable for applications where many features exist but must be accessed easily.

Key UI/UX Principles Applied:

Principle	Implementation
Chunking	Options divided into groups of three per screen
Memory Recall	Use of familiar icons and repeated layout
Consistency	Same structure across all category screens
Minimalism	Only necessary elements per screen
Visual Hierarchy	Large icons, clear labels, proper spacing
Recognition over Recall	Icons help users recognize actions quickly

Conclusion:

This interface successfully demonstrates how **chunking information into small groups** and using **memory recall through icons and consistent layouts** can create an intuitive and easy-to-use design. Users can navigate the system without confusion because each screen represents a clear mental category, improving usability and learning speed.
